Experience

Amazon | Software Development Engineer

Mar 2025 – June 2026

- Maintained and enhanced distributed microservices powering billing, subscription lifecycle, taxation, and notification orchestration for Amazon's satellite connectivity platform using Java, AWS, and event-driven architectures.
- Designed and implemented asynchronous workflows using AWS Step Functions, Lambda, SQS, and REST APIs to support invoice consolidation, remorse returns, and suspend/unsuspend service operations at scale.
- Led cloud infrastructure expansion into multiple European regions by provisioning secure AWS networking, deployment pipelines, and region-specific infrastructure configurations using AWS CDK and CloudFormation.
- Improved service reliability and operational visibility by implementing API throttling strategies, observability and telemetry enhancements, monitoring dashboards, and secure AWS IAM/VPC connectivity patterns across distributed systems.
- Built automated tax exemption notification and auditing workflows using DynamoDB, EventBridge, Lambda, and serverless processing patterns to ensure scalable and compliant customer data handling.
- Collaborated cross-functionally with software engineers, support teams, and product stakeholders to deliver scalable backend features and operational tooling in a fast-paced cloud-native environment while participating in on-call rotations to troubleshoot production incidents and improve system resiliency.
- Leveraged AI-assisted engineering tools to accelerate debugging, implementation, code reviews, and development workflows, improving overall engineering productivity and iteration speed.

Amazon | Software Development Engineering Intern

May 2024 – Aug 2024

- Designed and implemented a modular NSFW filtering pipeline for AmazonBot's large-scale web crawler using Python, AWS SQS, S3, and CloudFormation, enabling asynchronous queue-based processing and scalable ingestion of web content with improved moderation accuracy (10% false positives, 6% false negatives).
- Built cloud-native data processing and analytics workflows by storing crawler outputs as CSV files in Amazon S3 and querying large-scale datasets with AWS Athena SQL.

Wikimedia Foundation | Software Engineering Intern

Oct 2022 – Mar 2023

- Built an interactive participant dashboard using Flask/Django, React, PostgreSQL, and SQL-based data synchronization pipelines to manage and visualize Wikimedia contest participant and media datasets.
- Developed backend and frontend features for syncing user and image metadata from relational databases, improving accessibility and operational efficiency for Wiki Loves Monuments contributors and organizers.

ScholarX Technologies Limited | Software Engineer

Jan 2019 – Dec 2022

- Implemented interactive educational platform features using ReactJS and TypeScript within a monolithic application architecture, improving usability and engagement for students and partner organizations.
- Collaborated with cross-functional teams to build responsive frontend components and scalable web application functionality aligned with product and business requirements.

Education

Austin Peay State University (GPA 4.0/4.0)

2023 - 2025

Major: Computer Science | Minor: Quantitative Methods (Time Series, Machine Learning)

Certification & Skills

AWS Solutions Architect - Associate

AWS, GCP, SQL, Python, Typescript/Javascript, Java, Kotlin, Flask, Django, Git, Kubernetes, Terraform
